The efficiency of information transmission by brain is one of the major interests that have been recently studied, both through data analysis and theoretical modeling [1, 2, 3]. Recent attempts to quantify information transmission have concentrated on treating neuronal communication process in the spirit of Shannon information theory. It was developed as a mathematical, probabilistic framework for quantifying information transmission in communication systems [4].

The fundamental concept of this theory is *mutual information*, which quantifies the information dependence of random variables or stochastic processes. If  $\{X\}$  and  $\{Z\}$  are input (e.g. stimuli) and output (e.g. observed reaction) stochastic processes, then mutual information between them is given as:  $I(X; Z) := H(X) + H(Z) - H(X, Z)$ , where  $H(\cdot)$  are entropies [5]. Entropies of processes with unknown distributions (containing output process  $Z$ ) have to be estimated and we accomplished it with Strong estimator [3, 6] as it is reliable and computationally fast. Maximal mutual information, called channel capacity,  $C = \sup_{p_X} I(X; Y)$ , reflects the upper bound on amount of information that can be communicated over the channel.

For neuron model we chose that proposed by Levy & Baxter [3, 7]. Our *brain-like* neural network model (Fig. 1) consists of number of paired *excitatory E* and *inhibitory I* neurons. Such two neurons constitute a *node (E, I)*. Output of one neuron within a given node becomes input of the other one in the next discrete moment. Inhibitory neurons act to hold back activation of excitatory neurons they are paired with. Each node  $(E, I)_i$  is connected with neighboring nodes  $(E, I)_{i-1}$  and  $(E, I)_{i+1}$  through output of neuron  $E_i$ . Other nodes can be connected through *long-range connections*. Some or all neurons  $E_i$  can be connected to the source of information, i.e a discrete, one-zero (*spike* or *no-spike*) stochastic process.

We search for maximal values of mutual information between input process  $\{X\}$  and outputs of excitatory neurons  $\{Z\}$ s. We ran multiple simulations for architectures presented in Fig. 1. The information source parameters were as follows: *firing-rate*  $0 \leq f_r \leq 1$  in steps of 0.05 and sequences of 1 000 000 bits were generated to reach high accuracy. Parameters associated with neurons were:

Figure 1: All *brain-like* neural architectures we studied. Each one has five nodes and source of size three. **A**, a *symmetric* case. **B**,  $E_2$  has no access to the source of information. **C**, *symmetric* case with added *long-range* connection from  $E_2$  to  $E_5$ . **D**, a combination of B and C.

Figure 2: Mutual information between input process  $X$  and outputs of  $E$  neurons for architectures B, C, D (symmetric architecture result drawn with dashed line), maximized over: firing-rate  $f_r$ , synaptic success  $s$  and activation threshold  $g$ . Optimal values for each neuron marked with  $\times$ .

synaptic success  $0 \leq s \leq 1$  in steps of 0.05, activation threshold  $g \in \{0.2, 0.3, 0.5, 0.7, 0.9, 1, 1.2, 1.6\}$  and amplitude fluctuations were distributed uniformly on interval  $[0; 1]$ . Neural network was parametrized with inhibition strength  $b \in \{0, 1/4, 1/2, 3/4, 1, 3/2\}$  (relative to excitatory neurons strength).

**Results** are presented in Fig. 2. Most neurons reach the optimal information transmission around point where inhibition balances excitation, i.e. for  $b = 1$ . Generally, neurons are least efficient if there is no inhibition at all, i.e. for  $b = 0$ .

Efficiency of transmission of excitatory neuron lacking access to the source of information is decreased even by 62%, while other neurons efficiency rises by 7–13%, depending on inhibition strength. Long-range connection, if it originates from neuron having access to the source, brings 23–27% loss to target excitatory neuron transmission efficiency. If the connection originates from neuron without access to the source, the efficiency of target neuron is unchanged.
